Speed Flash Photo by J. C. Allen & Son

Speed Flash Photography opens up a new world of picture taking possibilities. You will be amazed at the many photographic adventures waiting to be explored with this new Photoflash Synchronizer.

The Kalart Micromatic Speed Flash being adjustable for time delay by one thousandths part of a second can be used with practically any modern camera. By this hair line timing it is also possible to accurately adjust the Synchronizer for all makes of flash bulbs as well as for individual shutter characteristics. A slight turn of the milled Micromatic tension knob will increase or decrease the time delay between electrical contact and shutter action. A series of five calibrated dots mark the several adjustment positions for all Compur and Kodamatic shuttered cameras, the Argus, National Graflex, Contax and Leica. The Synchronizer is fitted with phone tip terminals which plug into the 4½ volt bakelite battery case. This simple connection thereby permits the use of several accessories for firing multiple lamps in synchronism with the shutter. Color photographers will especially appreciate this convenience.

The cover of this leaflet was made with two photoflash bulbs, one at the camera, and the other fired from the right, attached to an extension cord plugged into a 9 volt battery case at 1/200 sec. F16.

Kalart Micromatic Speed Flash attached to
Kodak Retina Camera. Ready to shoot.

THE KALART MICROMATIC SPEED FLASH

attaches to and operates with all cameras
such as:
